HIGH PRECISION HEAT TRANSFER FROM IRT

IRT Batch Oven is a flexible infrared oven that delivers full heat output in seconds, saving time, space and money in every industrial paint process.

IRT Batch Oven uses short-wave infrared technology that handles all types of conveyor wet/dry paint processes. It is easy to control, provides full heat immediately and penetrates the paint completely. The operator can select output automatically with non-contact pyrometer control, and user-friendly HMI. The paint cures from the inside and out without retaining solvents and moisture that gives rise to problems with quality. Heat losses to the air are minimal and all energy is transferred to the surface to be dried. IRT specializes in infrared heating, drying and UV curing, holding a market leading position for over 50 years.
